Gene Expression Profiling By Microarrays Clinical Implications:

Gene Expression Profiling by Microarrays Wolf-Karsten Hofmann, 2006-06-22 Microarray analysis is a highly efficient tool for assessing the expression of a large number of genes simultaneously and offers a new means to classify cancer and other diseases Gene expression profiling can also be used to predict clinical outcome and response to specific therapeutic agents This survey spans recent applications of microarrays in clinical medicine covering malignant disease including acute leukaemias lymphoid malignancies and breast cancer together with diabetes and heart disease Investigators in oncology pharmacology and related clinical sciences as well as basic scientists will value this review of a promising new diagnostic and prognostic technology

Statistical Analysis of Gene Expression Microarray Data Terry Speed, 2003-03-26 Although less than a decade old the field of microarray data analysis is now thriving and growing at a remarkable pace Biologists geneticists and computer scientists as well as statisticians all need an accessible systematic treatment of the techniques used for analyzing the vast amounts of data generated by large scale gene expression studies

Methods of Microarray Data Analysis IV Jennifer S. Shoemaker, Simon M. Lin, 2004-10-29 As studies using microarray technology have evolved so have the data analysis methods used to analyze these experiments The CAMDA conference plays a role in this evolving field by providing a forum in which investors can analyze the same data sets using different methods *Methods of Microarray Data Analysis IV* is the fourth book in this series and focuses on the important issue of associating array data with a survival endpoint Previous books in this series focused on classification Volume I pattern recognition Volume II and quality control issues Volume III In this volume four lung cancer data sets are the focus of analysis We highlight three tutorial papers including one to assist with a basic understanding of lung cancer a review of survival analysis in the gene expression literature and a paper on replication In addition 14 papers presented at the conference are included This book is an excellent reference for academic and industrial researchers who want to keep abreast of the state of the art of microarray data analysis Jennifer Shoemaker is a faculty member in the Department of Biostatistics and Bioinformatics and the Director of the Bioinformatics Unit for the Cancer and Leukemia Group B Statistical Center Duke University Medical Center Simon Lin is a faculty member in the Department of Biostatistics and Bioinformatics and the Manager of the Duke Bioinformatics Shared Resource Duke University Medical Center

Molecular Genetic Testing in Surgical Pathology John D. Pfeifer, 2006 Written by experts from Washington University School of Medicine this text is a thorough review of the specific molecular genetic techniques that can provide diagnostically useful molecular genetic information on tissue samples including cytogenetics fluorescence in situ hybridization FISH PCR electrophoresis and hybridization analysis DNA sequence analysis and microarrays The first part of the book describes each technique indicates its advantages disadvantages capabilities and limitations and systematically addresses sensitivity and specificity issues Subsequent chapters organized by organ system detail the specific applications of these tests in surgical pathology More than 150 full color and black and white illustrations

Transcription Networks M. Francis Shannon, Sudha Rao, 2006-09 While every cell of an organism has an identical genomic content extremely complex networks exist to tailor the genomic output to the needs of that cell This program of gene expression is different for every cell type and stage of development In addition the cell can respond to its environment by modulating its gene expression program in a fairly dramatic manner For many decades gene transcription has been investigated in systems from bacteria to mammalian cells and along the way many landmark findings have set new paradigms that often apply across wide evolutionary distances Studying individual genes however especially in mammalian systems has been a painstaking business and although we know the transcription activators and other complexes that control specific genes in minute detail generalizing these findings has often proven to be difficult It has become clear that transcription factors do not operate alone but form complex networks in the cell If one component of this complexity is disturbed then there are repercussions across the entire network but it has been impossible to study these networks until very recently The advent of microarray technology within the last decade has revolutionized how we study gene transcription There are several types of array technology that essentially screen for relative mRNA levels for many thousands of genes at once We do not focus here on the technology as this has become routine and is available to many researchers Microarray technology has given us the ability to measure the entire gene expression program of a cell in a single experiment and compare it to other cells thus allowing a global view of cell behaviour at the level of gene transcription Expression profiling as this endeavour has become known is now a relatively simple undertaking and hundreds probably thousands of papers have been published demonstrating the power of this technology Expression profiling has been applied to many diverse biological problems and is also being developed as a method for disease diagnosis especially in the cancer classification field There are constant improvements or modified uses of the technology that are allowing more and more high throughput experiments to be carried out **Inflammation and Cancer** Serguei V. Kozlov, 2009-05-26 According to the most recent clinical oncology

data one out of seven newly diagnosed malignancies worldwide result from infection and chronic inflammation in conjunction with cancer In Inflammation and Cancer Methods and Protocols expert researchers deliver a systematic guide to techniques addressing various aspects of experimental cancer biology selectively focused on inflammation mediated tumorigenesis while promoting improvisations on a per case basis Volume 2 Molecular Analysis and Pathways is devoted to an extensive

description of experimental strategies aimed at investigating the molecular cross talks between components of cell signaling chains and their ramifications in diagnostic development and drug target discovery Written in the highly successful Methods in Molecular Biology™ series format chapters include brief introductions to their subjects lists of the necessary materials and reagents step by step laboratory protocols and a notes section which examines tips on troubleshooting and avoiding known pitfalls Comprehensive and cutting edge Inflammation and Cancer Methods and Protocols promises to serve as a vital guide and resource for investigators and clinicians working toward the goal of combatting the estimated 2 200 inflammation related oncogenesis fatalities occurring every day
