Protocols Ralf Kühn,Wolfgang Wurst,2014-10-30 Following the completion of the mouse and human genome sequences a major challengeisthefunctionalcharacterizationofeverymammaliangeneandthedeciph ing of their molecular interaction

network The mouse offers many advantages for the use of genetics to study human biology and disease unmatched among other mammals Its development body plan physiology behavior and diseases have much in common based on the fact that 99% of the human genes have a mouse ortholog The investigation of gene function using mouse models is based on many years of technological development In the two decades since gene targeting in murine embryonic stem ES cells was first described by Mario Capecchi and colleagues more than 3000 predesigned mouse mutants have been developed To date a variety of mouse mutagenesis techniques either gene or phenotype driven are used as systematic approaches The availability of the genome sequence supports gene driven approaches such as gene trap and targeted mutagenesis in ES cells allowing efficient and precise gene disruption In combination with the use of site specific DNA recombinases in particular the Cre loxP system gene disruption can be directed to specific cell types in conditional mouse mutants Furthermore

chemical and transposon mutagenesis of the mouse genome enables us to perform phenotype driven screens for the unbiased identification of phenotype genotype correlations involved in models of human disease Over the next several years the mouse genome will be systematically altered and the techniques for achieving predesigned manipulations will be constantly developed further and improved The second edition of Gene Knockout Protocols brings together distinguished contributors with extensive experience in the gene targeting and mouse genetics fields

Gene Knockout Protocols. Methods in Molecular Biology Martin J. Tymms, Ismail Kola, 2001 As the major task of sequencing the human genome nears completion and the full complement of human genes are catalogued the task of understanding the normal biological functions of genes and how their alteration leads to diseased states becomes more imperative In Gene Knockout Protocols highly skilled investigators with extensive experience in gene targeting and mouse genetics describe their best techniques for the design of targeting constructs and for genetic phenotype analysis These proven methods contain step by step instructions as well as notes on pitfalls to avoid and emphasize techniques that are relevant to researchers carrying out gene targeting work These include embryo transplantation in vitro embryonic stem cell differentiation creation of aggregation chimeras mouse pathology embryo cryopreservation and transplantation Issues such as the use of existing mouse mutation resources and the influence of genetic background and epigenetic effects upon phenotype are also covered State of the art and highly practical Gene Knockout Protocols not only constitutes an invaluable source of readily reproducible techniques for those just entering the field of gene targeting but also a key reference for all genetic researchers today

Gene Targeting Protocols Eric B. Kmieciak, 2013-08-14 The potential now exists in many experimental systems to transfer a cloned modified gene back into the genome of the host organism In the ideal situation the cloned gene is returned to its homologous location in the genome and becomes inserted at the target locus This process is a controlled means for the repair of DNA damage and ensures accurate chromosome disjunction during meiosis The paradigm for thinking about the mechanism of this process has emerged primarily from two sources 1 The principles of reaction mechanics have come from detailed biochemical analyses of the RecA protein

purified from *Escherichia coli* and 2 the principles of information transfer have been derived from genetic studies carried out in bacteriophage and fungi A compelling picture of the process of homologous pairing and DNA strand exchange has been influential in directing investigators interested in gene targeting experiments The ability to find and pair homologous DNA molecules enables accurate gene targeting and is the central phenomenon underlying genetic recombination Biochemically the overall process can be thought of as a series of steps in a reaction pathway whereby DNA molecules are brought into homologous register the four stranded Holliday structure intermediate is formed heteroduplex DNA is extended and DNA strands are exchanged Not much is known about the biochemical pathway leading to homologous recombination in eukaryotes
