*Evolutionary Wind Turbine Placement Optimization with Geographical Constraints* Daniel Lücke, 2017-05-26 Daniel Lücke presents different approaches to optimize locations of multiple wind turbines on a topographical map The author succeeds in significantly improving placement solutions by employing optimization heuristics He proposes various real world scenarios that represent real planning situations Advanced evolutionary heuristics for the turbine placement optimization create not only highly optimized solutions but also significantly different solutions to give decision makers optimal choices As a matter of fact wind turbines play an important role towards green energy supply An optimal location is essential to achieve the highest possible energy efficiency

**Water Resources Research Progress** Liam N. Robinson, 2008 Water resources are sources of water that are useful or potentially useful to humans They are important because they are needed for life to exist Many uses of water include agricultural industrial household recreational and environmental activities Virtually all of these human uses require fresh water Only 2.7% of water on the Earth is fresh water and over two thirds of this is frozen in glaciers and polar ice caps leaving only 0.007% available for human use Fresh water is a renewable resource yet the world's supply of clean fresh water is steadily decreasing Water demand already exceeds supply in many parts of the world and as world population continues to rise at an unprecedented rate many more areas are expected to experience this imbalance in the near future The framework for allocating water resources to water users where such a framework exists is known as water rights This new book presents recent and important research in the

Nature-Inspired Computing Nazmul H. Siddique, Hojjat Adeli, 2017-05-19 Nature Inspired Computing

Physics and Chemistry Based Algorithms provides a comprehensive introduction to the methodologies and algorithms in nature inspired computing with an emphasis on applications to real life engineering problems. The research interest for Nature inspired Computing has grown considerably exploring different phenomena observed in nature and basic principles of physics, chemistry and biology. The discipline has reached a mature stage and the field has been well established. This endeavour is another attempt at investigation into various computational schemes inspired from nature which are presented in this book with the development of a suitable framework and industrial applications. Designed for senior undergraduates, postgraduates, research students and professionals, the book is written at a comprehensible level for students who have some basic knowledge of calculus and differential equations and some exposure to optimization theory. Due to the focus on search and optimization, the book is also appropriate for electrical, control, civil, industrial and manufacturing engineering, business and economics students as well as those in computer and information sciences. With the mathematical and programming references and applications in each chapter, the book is self-contained and can also serve as a reference for researchers and scientists in the fields of system science, natural computing and optimization.

Computational intelligence is a component of Encyclopedia of Technology Information and Systems Management Resources in the global Encyclopedia of Life Support Systems EOLSS which is an integrated compendium of twenty-one Encyclopedias. Computational intelligence is a rapidly growing research field including a wide variety of problem-solving techniques inspired by nature. Traditionally, computational intelligence consists of three major research areas: Neural Networks, Fuzzy Systems, and Evolutionary Computation. Neural networks are mathematical models inspired by brains. Neural networks have massively parallel network structures with many neurons and weighted connections. Whereas each neuron has a simple input-output relation, a neural network with many neurons can realize a highly non-linear, complicated mapping. Connection weights between neurons can be adjusted in an automated manner by a learning algorithm to realize a non-linear mapping required in a particular application task. Fuzzy systems are mathematical models proposed to handle inherent fuzziness in natural language. For example, it is very difficult to mathematically define the meaning of cold in everyday conversations such as "It is cold today" and "Can I have cold water?" The meaning of cold may be different in a different situation. Even in the same situation, a different person may have a different meaning. Fuzzy systems offer a mathematical mechanism to handle inherent fuzziness in natural language. As a result, fuzzy systems have been successfully applied to real-world problems by extracting linguistic knowledge from human experts in the form of fuzzy IF-THEN rules. Evolutionary computation includes various population-based search algorithms inspired by evolution in nature. Those algorithms usually have the following three mechanisms: fitness evaluation to measure the quality of each solution, selection to choose good solutions from the current population, and variation

operators to generate offspring from parents Evolutionary computation has high applicability to a wide range of optimization problems with different characteristics since it does not need any explicit mathematical formulations of objective functions For example simulation based fitness evaluation is often used in evolutionary design Subjective fitness evaluation by a human user is also often used in evolutionary art and music These volumes are aimed at the following five major target audiences University and College students Educators Professional practitioners Research personnel and Policy analysts managers and decision makers
