Evolutionary Ecology of Freshwater Animals Bruno Streit, T. Städler, Curtis Lively, 2012-11-01 Evolutionary ecology includes aspects of community structure trophic interactions life history tactics and reproductive modes analyzed from an evolutionary perspective Freshwater environments often impose spatial structure on populations e g within large lakes or among habitat patches facilitating genetic and phenotypic divergence Traditionally freshwater systems have featured prominently in ecological research and population biology This book brings together information on diverse freshwater taxa with a mix of critical review synthesis and case studies Using examples from bryozoans rotifers cladocerans molluscs teleosts and others the authors cover current conceptual issues of evolutionary ecology in considerable depth The book can serve as a source of critically evaluated ideas detailed case studies and open problems in the field of evolutionary ecology It is recommended for students and researchers in ecology limnology population biology and evolutionary biology

Evolutionary Ecology,1977

Systematics, Historical Ecology, and North American Freshwater Fishes Richard L. Mayden,1992 This book addresses the current need for a holistic approach in comparative and evolutionary biology and offers numerous applications of the modern methods of phylogenetic systematics and historical ecology using the North American fish fauna as its case study This major synthesis the first published work of its kind provides a theoretical and methodological foundation for future studies in ichthyology evolutionary biology and other fields of comparative biology Several introductory pieces present major statements of general principles detailed examinations of the diversity and distributions of North American freshwater fishes and what is known of their systematic relationships The rest of the volume's 30 papers then contribute new phylogenetic hypotheses for a significant number of taxa Along the way the reader is introduced to the principles first of phylogenetic systematics the reconstruction of evolutionary or ancestor descendant relationships of groups of organisms on the basis of heritable traits and second of historical ecology a comprehensive research program that links systematics with many areas of comparative biology Together the two allow for the formulation of direct and testable hypotheses regarding the evolution of species and their attributes interspecies interactions and the formation and persistence of biotic communities Without these methods that incorporate historical controls our estimates of history for all areas of biology are inefficient indirect and worst of all untestable This book focuses on North American freshwater fishes not only because the 42 contributors know them so well

but also because this highly diverse fauna is well known in so many important aspects diversity species distributions life histories relevant to evaluating general applications of the new paradigms of systematics and historical ecology Many other faunas present interesting biotas appropriate for the preparation of a similar piece of work but no other fauna can claim as complete a knowledge base The theme articulated throughout the book underscores the Darwinian proposition of descent with modification The biological information particular to the North American freshwater fish fauna establishes an invaluable foundation for understanding diversification and advancing education and research Moreover the methods theories and empirical data presented serve as essential resources for comparative and evolutionary research programs applicable to any biota or taxonomic grouping The book includes some 200 illustrations 60 tables 10 appendixes and comprehensive taxonomic and subject indexes BOOK JACKET Title Summary field provided by Blackwell North America Inc All Rights Reserved

Threatened Freshwater Animals of Tropical East Asia David Dudgeon, 2022 This book offers a comprehensive account of the current state of inland waters in tropical and subtropical East Asia exploring a series of case studies of freshwater fish reptiles amphibians birds and mammals and water bodies at particular risk The book highlights the rich freshwater biodiversity of tropical East Asia and draws attention to the various threats it faces due to human activities and rapid environmental change It addresses the question of whether the contributions of these animals and habitats or biodiversity in general to ecosystem functioning and service provision provide sufficient basis for arguments supporting nature conservation Drawing on instances from the rivers and lakes of tropical East Asia the book also asks whether the benefits accruing from intact ecosystems are likely to be enough to ensure their preservation If the answer to either or both these questions is no then what are the prospects for freshwater biodiversity in rapidly changing tropical East Asia This book will be of interest to students and scholars of biodiversity conservation freshwater ecology ecosystem services and Asian Studies

Evolutionary Ecology Anne E. Magurran, 2005-08-25 This book celebrates the guppy's unique contribution to evolutionary ecology Ever since Caryl Haskins described guppy populations as a natural experiment because of the way predation pressure varies over a small geographical area generations of researchers have been drawn to Trinidad to investigate evolution in the wild The species continues to provide classic examples of natural selection in action and elegantly illustrates how ecology evolution and behaviour are interlinked Anne Magurran's account of the evolutionary ecology of the guppy integrates historical breakthroughs with new research in this fast moving field She reveals how guppies provided some of the first evidence of sperm competition and sexual selection and how they continue to inform scientific thought on mating systems and cryptic choice The consequences of variation in predation risk as well as a host of other biotic and abiotic factors are described and evaluated at all life stages from conception to death The book discusses behavioural responses to ecological conditions alongside life history patterns It examines the potential for ecological speciation and discusses new research into how reproductive isolating mechanisms become established in promiscuous mating systems Conservation

issues are also considered both in terms of protecting the irreplaceable Trinidadian guppy system and in the context of invasion ecology This timely synthesis of research into a species that has raised key questions in evolutionary ecology will be of great interest to graduate level students as well as professional researchers in the fields of behavioural ecology and evolutionary biology *Evolutionary Ecology of Social and Sexual Systems* J. Emmett Duffy, Martin Thiel, 2007-09-06

Understanding of animal social and sexual evolution has seen a renaissance in recent years with discoveries of frequent infidelity in apparently monogamous species the importance of sperm competition active female mate choice and eusocial behavior in animals outside the traditional social insect groups Each of these findings has raised new questions and suggested new answers about the evolution of behavioral interactions among animals This volume synthesizes recent research on the sexual and social biology of the Crustacea one of the dominant invertebrate groups on earth Its staggering diversity includes ecologically important inhabitants of nearly every environment from deep sea trenches through headwater streams to desert soils The wide range of crustacean phenotypes and environments is accompanied by a comparable diversity of behavioral and social systems including the elaborate courtship and wildly exaggerated morphologies of fiddler crabs the mysterious queuing behavior of migrating spiny lobsters and even eusociality in coral reef shrimps This diversity makes crustaceans particularly valuable for exploring the comparative evolution of sexual and social systems Despite exciting recent advances however general recognition of the value of Crustacea as models has lagged behind that of the better studied insects and vertebrates This book synthesizes the state of the field in crustacean behavior and sociobiology and places it in a conceptually based comparative framework that will be valuable to active researchers and students in animal behavior ecology and evolutionary biology It brings together a group of internationally recognized and rising experts in fields related to crustacean behavioral ecology ranging from physiology and functional morphology through mating and social behavior to ecology and phylogeny Each chapter makes connections to other non crustacean taxa and the volume closes with a summary section that synthesizes the contributions discusses anthropogenic impacts highlights unanswered questions and provides a vision for profitable future research **An Introduction to Evolutionary Ecology** Andrew Cockburn, 1992 **Evolution and the Aquatic Ecosystem** Jennifer L. Nielsen, Dennis A. Powers, 1995 Provides empirical theoretical and philosophical insights into the evolution of aquatic ecosystems from perspectives that range from molecular and cellular biology to ecology and behavior The 36 papers and panel discussions were reviewed across disciplines and presented at a May 1994 conference in Monterey California They cover general perspectives morphology and systematics behavior and life history genetics and ecosystems and habitat The Evolutionary Ecology of Animals Migration R. Robin Baker, 1978 Evolutionary Ecology of Neotropical Freshwater Fishes Thomas M. Zaret, 1984
