Abstract

Let Q be a finite connected quiver and Λ be the radical square zero algebra of Q . We give a bijection between the reduced differential projective modules over Λ and the representations of the opposite quiver of Q . If Q has oriented cycles and Q is not a basic cycle, we prove that the algebra of dual numbers over Λ is not virtually Gorenstein.

1 Introduction

Given a ring Λ , a *differential Λ -module* is a pair (M, d_M) , where M is a Λ -module and d_M is an endomorphism of M such that $d_M^2 = 0$. If M, N are differential Λ -modules, a *differential Λ -module map* is a Λ -module map $f: M \rightarrow N$ such that $f d_M = d_N f$. A Λ -module map $f: M \rightarrow N$ is *null homotopic* if there exists a Λ -module map $r: M \rightarrow N$ such that $f = r d_M + d_N r$.

Let M be a differential Λ -module. The *shift* $\Sigma(M)$ of M is $(M, -d_M)$. We say M is *contractible* if the identity map of M is null homotopic, M is *reduced* if M has no nonzero contractible direct summand.

By the term *differential projective Λ -module*, we mean a differential Λ -module whose underlying Λ -module is projective. Finitely generated differential projective modules are called *perfect differential modules* in [21].

The theory of complexes has been extensively studied in decades. However, few people investigate differential modules in detail. L. L. Avramov, R.-O. Buchweitz and S. Iyengar [4] study the projective class as well as free class and flat class for differential modules. C.
